I am planning a new desktop system. If you are interested in building it for me, it will include:

- AMD Ryzen 9 7950X processor.
- Appropriate fan.
- 192 GB RAM.
- X670 or X670E based motherboard with at least 4 PCIe slots.
- Normal case that doesn't look too silly and will take at least two 3½" drives.
- High efficiency power supply (Antec EarthWatts or similar).
- 2 TB M.2 SSD, as fast as possible.
- DVD drive.
- Possibly two NVIDIA graphics cards. The system will drive four monitors. One has only a dual link DVI connector. The others all have single link DVI and D-Sub, and two of them have HDMI inputs. The speed of the graphic cards is not important, but they should be capable of driving the monitors, possibly with adapters. I have older cards that will do this, but something newer would be good.

If you are interested in building it, please let me know pricing, exact specs and timing. I'm also open to alternatives. You can reach me at (03) 5309 0418 or at grog@lemis.com.

The machine will run the FreeBSD operating system, which I intend to install myself. If you prefer to install it for testing purposes, I can supply you with an SD card or DVD.

I have existing monitors, keyboards and other components, so this is all I really need.
